Solar power generation systems are classified into a serial system (system in which a plurality of solar power generation units are connected serially) and a parallel system (system in which a plurality of solar power generation units are connected in parallel). As a method of preventing a decline in output of a solar power generation system, there is a technology in which, if an electric power system is unstable, a solar power generation system or a transformer connected to the solar power generation system is driven to reverse. When a transformer is used for a transformer group including an inverter that generates electric power from a generated direct current voltage of a direct current power source generated by a solar power generation system and also uses the generated electric power for drive, the inverter is used as a vehicle-mounted power generation system. As disclosed in Patent Documents 1 and 2, in the case of an inverter using a thyristor,
